

New marine and wildlife habitat at Roberts Bank will increase biodiversity.

Deltaport East Causeway Habitat Compensation Project

As part of the Deltaport Third Berth Project (DP3) at the Deltaport container terminal at Roberts Bank, Port Metro Vancouver will begin creating new fish and wildlife habitat along the east causeway portion of Deltaport Way. Roberts Bank is recognized as an important ecological area. Through this project, Port Metro Vancouver will help to increase the biodiversity and environmental sustainability of this area.

The East Causeway Habitat Compensation Project will transform the land beside the Deltaport causeway into diverse marine and wildlife habitat through the creation of barrier islands, rip rap slopes, salt marsh, upland vegetation areas, and gravel and cobble beaches.

Construction on the East Causeway Habitat Compensation Project will commence mid-June 2009 and is expected to be complete by early 2011.

Public access changed to protect wildlife.

During construction and upon completion of the project, parking will no longer be available along the east causeway area. Public access will be permanently closed as the area will be transformed into sensitive wildlife habitat. After construction is complete, Port Metro Vancouver will work with the community to identify opportunities to learn about and possibly visit this unique habitat area.
